MOLD-RAM™ Delivers Long-Term Protection On Wide Variety of Construction Materials

(Roswell, GA) MOLD-RAM is the new surface mold and mildew prevention product from Sostram Corporation. Ideal for use on wood, wallboard, concrete and masonry (cinder) block construction materials, it can be applied during construction or to appropriate areas of existing structures. MOLD-RAM is also suitable for use by mold remediators, following removal of all existing mold and correction of conditions favorable to new growth.

EPA-registered MOLD-RAM contains the active ingredient chlorothalonil, one of the world's most respected contact fungicides. It is the only chlorothalonil product labeled for such a broad range of building materials in new home construction. MOLD-RAM prevents surface mold and mildew by interrupting the metabolic activity of the fungal pathogens commonly associated with building materials and offers tank-mix flexibility when mixed with borate products used for termite control and wood decay.

MOLD-RAM is easily applied by licensed pest control professionals or certified mold remediators using a sprayer or paintbrush. If desired, a spray dye indicator or permanent dye can be added to the solution to track the spray pattern. Effective at very low rates, 2.5 ounces of MOLD-RAM mixed with one gallon of water treats 500 square feet. Key treatment areas include:

- All wood surfaces
- Wall and partition bottom plates in contact with concrete
- Surfaces of exterior wall sheathing
- Masonry surfaces such as basement and foundation walls
- Open or closed crawl spaces
- Non air-conditioned areas such as garages and attics

As a preventive product, MOLD-RAM forms the foundation of a comprehensive surface mold and mildew management program. It delivers excellent long-term protection, but does not remove existing mold. MOLD-RAM is available through distributors in 1-quart tip-and-measure containers.
